

Smart Water Management

Proof of Concept

As the Proof of Concept we are demonstrating the Centralized automation of the water control stations. The Centralized control involves three Control stations that switch, regulate and measure the water flow.

All the control stations are accessible and can be controlled through the cloud. Status indicators will show the status of the Control stations. They show the status of Pumps, Valves and the water flow.

Hence the Water flow automation and centralized control forms the Smart Water Management System.
